

Completion

1. Direct QASM parse

parsed

2. Fenced code block

parsed

3. Restricted Python run

parsed

All fail: $R = 0$

Circuit c
→ rubric score

```
graph TD; Completion[Completion] --> Step1[1. Direct QASM parse]; Step1 -- parsed --> Circuit[Circuit c -> rubric score]; Step1 -- fails --> Step2[2. Fenced code block]; Step2 -- parsed --> Circuit; Step2 -- fails --> Step3[3. Restricted Python run]; Step3 -- parsed --> Circuit; Step3 -- fails --> AllFail[All fail: R = 0];
```

The flowchart illustrates a sequential process for parsing and evaluating a circuit. It begins with a 'Completion' box, which leads to a series of three parsing attempts: '1. Direct QASM parse', '2. Fenced code block', and '3. Restricted Python run'. Each attempt has a 'parsed' path that leads to a final box labeled 'Circuit c → rubric score', and a 'fails' path that leads to the next attempt. If all three attempts fail, the process ends at a box labeled 'All fail: $R = 0$ '.
